SESSION 2024/2025 SEMESTER 1

COURSE CODE

SECV 2113 – Human Computer Interaction

LECTURER'S NAME

<<Dr. Nur Zuraifah Syazrah binti Othman>>

INDIVIDUAL ASSIGNMENT

TITLE

Good and Bad User Interface Design

STUDENT'S NAME

<KOO XUAN>

MATRIC NO <A23CS0300>

SECTION <01>

Product 1 - Huawei Mate XT (BAD DESIGN)

Describe the Purpose of the Overall Design / Interface

The Huawei Mate XT Ultimate Design aims to offer a luxurious, foldable smartphone that enhances multitasking, productivity, and media consumption. Its interface is designed to seamlessly transition between a compact phone and a tablet-like device when unfolded, providing users with flexibility and a high-end user experience. The goal is to push the limits of what smartphones can do by combining cutting-edge technology and premium design.

However, despite these ambitious goals, there are several aspects of the design that hinder its usability and fail to fully align with core usability goals and design principles.

Describe the Particular Aspects You Find Bad About the Huawei Mate XT

The main issue that I have found with this product is its fragility of the foldable screen. Although the foldable screen of Huawei Mate XT is innovative and attractive, frequent folding can cause creases, reducing the screen's visual quality and usability of the screen. Besides that, there are app optimization issues where many third-party apps are not yet optimized for foldable screens, leading to display issues like improper scaling, black bars, or distorted aspect ratios. Last but not least, the high price point of Huawei Mate XT had restricted its accessibility to a small segment of the market.

Explain Why They Are Bad Based on the Usability Goals and Design Principles You Learned in Class

Usability goals: The fragility of the foldable screen undermines the usability goal of reliability which a device should perform consistently and reliably without users having to worry about physical degradation. Moreover, the app optimization issues compromises the effectiveness and satisfaction usability goals, as users are unable to enjoy a seamless experience across all their apps. The inconsistency between app performance in folded and unfolded modes can lead to frustration. While the materials and foldable screen justify the cost to some extent, the price makes the device less attainable for most users. This negatively impacts the satisfaction goal, as the device is less likely to meet the needs and expectations of a broad audience.

Design principles: This foldable screen design contradicts the principle of consistency and standards. Users expect their devices to last and operate without significant changes in performance or appearance. The possibility of screen damage from normal usage breaks this expectation and affects user confidence in the product. Whereas the app optimization problem contradicts the principle of consistency. Users expect apps to function uniformly across different modes of the device. When apps fail to adapt properly, it breaks the flow of interaction and causes confusion or annoyance, diminishing the overall user experience. And also, The high price violates the principle of user-centered design. A device should be designed for the widest possible audience, and its price should be affordable for most users. In this case, the price limits its appeal and usability for average consumers, creating a barrier to entry.

Product 2 - Motorbike Umbrella Canopy (GOOD DESIGN)

Describe the Purpose of the Overall Design / Interface

The motor umbrella canopy is designed to provide essential protection for motorbike and scooter riders from environmental elements like rain, wind, and harsh sunlight. The interface seamlessly integrates into the motorbike setup, offering an extended cover without hindering the rider's field of vision. The overall purpose is to improve rider comfort, safety, and convenience, especially in unpredictable weather conditions, without the need for more expensive fully enclosed vehicles. It's a cost-effective solution that adds value by enhancing the riding experience while keeping the rider protected.

Describe the Particular Aspects You Find Good About the Motor Umbrella Canopy

The first good aspect of this product is its ability to shield riders from weather conditions. The canopy provides effective rain and sun protection, allowing riders to continue their journeys comfortably during harsh weather, which increases convenience and usability. Additionally, the transparent front windshield ensures excellent visibility, even during heavy rain, reducing the need for frequent wiping of the helmet's visor and thus contributing to safer rides. Moreover, the canopy's lightweight and removable design allows users to attach and detach it based on the day's weather or personal preferences, offering flexibility. Finally, the cost-effectiveness of the canopy makes it an appealing option for riders who may not want to invest in a fully enclosed vehicle but still need protection, making it an accessible product for a wide range of users.

Explain Why They Are Good Based on the Usability Goals and Design Principles You Learned in Class

Usability Goals: The motor umbrella canopy supports the usability goal of effectiveness by providing practical weather protection for the rider. It makes the riding experience more efficient and safer in the bad weather. It also enhances satisfaction since users enjoy greater comfort during their rides, knowing that they are shielded from elements like wind, rain, and sunlight. Additionally, the low cost of the product makes it widely accessible, contributing to user satisfaction and ensuring that it can meet the needs of a broad audience.

Design Principles: The transparent windshield aligns well with the design principle of visibility, ensuring the rider's field of vision remains clear and unobstructed, which is crucial for safety. The consistency of protection across different weather conditions, whether it's rain or sun, enhances the product's reliability. The flexibility of the canopy's installation and removal allows users to customize their experience based on weather or personal preference, promoting user-centered design. Finally, the affordability adheres to the principle of user-centered design by making the product accessible to a wide audience, meeting the needs of budget-conscious riders without sacrificing functionality.
