

Campus Booking System

Introduction

In a modern university, managing campus facilities like gyms, swimming pools, sports halls, and clinics is important to support both academic and extracurricular activities. Without a proper system, booking these facilities can lead to problems such as double bookings, underuse, or delays, which affect the user experience.

The Campus Facility Booking System is a Java-based application that helps automate and manage bookings for campus facilities. It allows students, staff, and administrators to easily view, request, and manage bookings. Admins can also monitor availability, handle conflicts, and manage waitlists.

CONCLUSIONS

The Campus Facility Booking System solves the problem of managing campus facility bookings in a simple, organized, and user-friendly way. This Java-based system helps students and staff book facilities like gyms, courts, clinics, and pools easily and fairly.

Our team worked well together by dividing the tasks for each module like user, facility tracking, and booking. This helped us develop and test everything smoothly.

Through this project, we improved our Java skills and learned how software can solve real problems in a university.

In the end, this project showed us how important teamwork and modular coding are in creating useful and efficient systems.
